

Hotel Booking Website Development Proposal

Developed By Metora Technologies
www.metora.in

This proposal outlines the development of a premium, secure, and scalable Hotel Booking Website built using modern technologies including React.js, Laravel, and MySQL. The platform will provide seamless booking experience, secure online payments, automated notifications, and a fully controlled administrative dashboard.

Technology Stack

- Frontend: React.js (Modern, fast, responsive UI)
- Backend: Laravel (Secure and scalable API architecture)
- Database: MySQL (Reliable structured data management)
- Payment Gateway Integration (Stripe / Razorpay or similar)

Core Website Features

- Premium responsive homepage with dynamic banners (Admin controlled)
- Advanced room listing with image gallery and amenities
- Real-time availability checking system
- Date selection (Check-in / Check-out)
- Secure online booking workflow
- Integrated online payment system
- Automated email confirmation system

Booking & Payment Workflow

- User selects room and booking dates
- System verifies availability
- User enters booking details
- Secure payment processing
- Booking stored in database
- Confirmation email sent to customer
- Admin receives booking and payment notification

Administrative Dashboard Features

- Secure Admin Authentication

- Full banner and homepage content management
- Add / Edit / Delete Rooms
- Upload multiple room images
- Manage room pricing and availability
- View and manage bookings
- View complete payment transaction history
- Approve / Cancel bookings
- User management system

Email Notification System

- Instant booking confirmation email
- Payment confirmation email
- Admin booking alert email
- Cancellation notification system

Security & Reliability

- Laravel authentication & authorization
- Password hashing and encrypted credentials
- CSRF & SQL injection protection
- Input validation and API security
- Secure payment gateway integration
- Scalable architecture for future expansion
